## 1. Introduction

### 1.1 OverView

We will be able to develop a web application using Flask. By the end of the project we'll learn best practices of combining Machine Learning Code , Machine Learning Model , HTML and CSS to buld a web application .

### 1.2 Purpose

In general, a person suffering from Pneumonia goes to the hospital for a X-Ray image and waits for the doctor to check the image manually himself and then decides whether the person has Pneumonia or not . The aim of this project is to help the doctors to predict the pneumonia disease more accurately using a deep learning model.

## 2. Literature Survey

### 2.1 Existing Problem

In general, a patient suffering from Pneumonia goes to the hospital to take an X-ray image waits for the doctor and then the doctor will check the X-ray then he decides whether the person has pneumonia or not. The results are not only concluded based on just seeing the X-ray images but furthermore, tests were conducted on the patient to verify the results of the doctor. The process is time-consuming and if the patient has severe pneumonia or not he has to wait several days to get the test results. But in recent developments of the artificial intelligence and the computational powers of the computers have increased it helps in predicting pneumonia by just passing the X-ray image as an input to our model.

### 2.2 Proposed Solution

The main objective of this project is to help the doctors to predict the pneumonia disease more accurately using a deep learning model. The objective is not only to help the doctors but also to the patients to verify whether they have pneumonia or not. By using this model we can precisely predict pneumonia. A convolutional neural network model is built from

# Documentation on Pneumonia Prediction Using X-RAY Images

scratch to extract features from a given chest X-ray image and classify it to determine if a person is infected with pneumonia. a web is built where the user can upload the x - ray image and the result is shown on the UI .

## 3. Theoretical Analysis

### 3.1 Block diagram

1. A Deep learning model is build on a dataset.
2. A frontend web UI is made using HTML to take inputs in form of images.
3. The the model is used in the backend of the web to predict the output.

### 3.2 FlowChart

Steps which are taken while developing this project

1. Data Collection
2. Data Preprocessing
3. Model Building
4. Web Application Building

## 4.Experimental Investigation

### 1.Data Collection

The Dataset is collected from [kaggle.com](https://www.kaggle.com) and divided into two folders test and train

### 2.Data Preprocessing

# Documentation on Pneumonia Prediction Using X-RAY Images

The Dataset that we got was already clean due to which we didn't have. Just the ImageDataGenerator was used to increase the number of images present in our test and train folder.

```
In [2]: #import imagedatagenerator
        from keras.preprocessing.image import ImageDataGenerator

        Using TensorFlow backend.

In [3]: #define parameter for train and test set
        train_data = ImageDataGenerator(featurewise_center=False, samplewise_center=False,
        featurewise_std_normalization=False, samplewise_std_normalization=False,
        zca_whitening=False, rotation_range=0, zoom_range = 0.1, width_shift_range=0.1,
        height_shift_range=0.1, horizontal_flip=False, vertical_flip=False)
        test_data = ImageDataGenerator(rescale=1./255, shear_range=0.2, zoom_range=0.2, horizontal_flip=True)

In [4]: #applying
        x_train = train_data.flow_from_directory(r'dataset/train', target_size=(64,64), batch_size=32, class_mode='binary')
        x_test = train_data.flow_from_directory(r'dataset/test', target_size=(64,64), batch_size=32, class_mode='binary')

        Found 5216 images belonging to 2 classes.
        Found 624 images belonging to 2 classes.
```

## 3. Model Building

After Preprocessing we start with the model building

1. adding all required libraries
2. Sequentialise the model
3. add the convolution2D layer with all parameters the input shape was taken as 64,64,3 and the activation function as relu but other functions could also be used

```
In [5]: #importing the model building libraries
        from keras.models import Sequential
        from keras.layers import Dense, Convolution2D, Flatten, MaxPooling2D, Dropout

In [6]: #initia. the model
        model = Sequential()

In [7]: #add the convolution 2d layer
        model.add(Convolution2D(32,(3,3),input_shape = (64,64,3),activation='relu'))
```

4. adding theMaxpooling layer then flatten layer
5. after this we will add the hidden layers of the neural network. There are 3 Dense layers which have half output node to that of their input
6. then we add the output layer which has 1 output node and after output layer we compile the model for loss, accuracy and also optimise

# Documentation on Pneumonia Prediction Using X-RAY Images

7. then we train the model and after training we save the model.

```
In [15]: #fitting the model
model.fit_generator(x_train, steps_per_epoch=250, epochs=25, validation_data=x_test, validation_steps=63)

Epoch 1/25
250/250 [=====] - 228s 914ms/step - loss: 0.3909 - accuracy: 0.8266 - val_loss: 0.7791 - val_accuracy: 0.7586
Epoch 2/25
250/250 [=====] - 325s 1s/step - loss: 0.1025 - accuracy: 0.9631 - val_loss: 0.2567 - val_accuracy: 0.7988
Epoch 25/25
250/250 [=====] - 329s 1s/step - loss: 0.1017 - accuracy: 0.9614 - val_loss: 0.0754 - val_accuracy: 0.8308

Out[15]: <keras.callbacks.callbacks.History at 0x1d5c1aade80>

In [16]: #save the model
model.save("Pneumonia_Prediction_model.h5")
```

the model achieved an accuracy of 96%

8. then we start to build our HTML page the design of the page depends on how you want it it does not follow any kind of rules. So i developed a very basic page which just has a few text , an image chooser and a button which on clicked used the AI model which was saved in last step to give an output and that is displayed . The HTML code is been uploaded on my github under a folder named as [template](#).
9. After the UI is made we start the python code using flask framework in this we import our model and provide it with the picture uploaded by the user then the model works on the picture and returns a render template with the html and text as arguments. the images which are given by the user are saved in a folder named [uploads](#) and the python file is named as [file.py](#).
10. After developing the model and web app now we need to run the application go to anaconda prompt or command prompt and to the location where the .py file is located and type the command "python file.py" and it will start the server.

# Documentation on Pneumonia Prediction Using X-RAY Images

```
C:\> Command Prompt - python file.py

C:\Users\kanan>d:

D:\>D:\Python\phyton\Website
'D:\Python\phyton\Website' is not recognized as an internal or external command,
operable program or batch file.

D:\>cd D:\Python\phyton\Website

D:\Python\phyton\Website>pthon file.py
'pthon' is not recognized as an internal or external command,
operable program or batch file.

D:\Python\phyton\Website>python file.py

```

11. now the web app is working load an image and see the output

# Documentation on Pneumonia Prediction Using X-RAY Images

## 5. Flowchart

run the python file and go to a web browser of your choice and enter the localhost id now when the page is loaded click on choose files and select an image on which you want to know the output then click predict cancer button. now the output will be shown.

## 6. Results

Finally our Web application can be used by running the python file and typing URL -localhost:5000 in a browser

## 7. Advantages & Disadvantages

The advantage of using Deep learning over learning technique like machine learning are :

- in this project we have lack of knowledge about all the features present in the images which can be used to identify pneumonia. in this case Deep learning is more useful as we have to worry less about the feature engineering that is taken care .
- we are using images as inputs as Deep Learning really shines when it comes to complex problems such as image classification, natural language processing, and speech recognition.
- no need for label data deep learning works well with unlabeled data.
- the results or the model which is developed is of high quality

The disadvantage of using Deep learning over learning technique like machine learning are :

- it requires a lot of data.
- a deep learning model is developed for a specific task it is not flexible to be used for

# Documentation on Pneumonia Prediction Using X-RAY Images

some other task.

- Neural Networks at the Core of Deep Learning are Black Boxes. It's impossible to look inside of it to see how it works. Just like in a human brain, the reasoning of a neural network is embedded in the behavior of thousands of simulated neurons, arranged into dozens or even hundreds of intricately interconnected layers.

## 8. Applications

It can be deployed within a hospital website or can be made into a dedicated website from where any one with an X-Ray can see the result.

## 9. Conclusion

By doing the above procedure and all we have successfully created a Deep learning CNN model and deployed it using Flask framework.

## 10. Future Scope

A new model with higher accuracy , detecting more than one diseases or developing a new UI for the web are some of the future scope of this project.
